

Sample Technical Document

A demonstration PDF for testing the translation tool

1. Introduction

This document is a sample PDF created specifically to test the **formatting preservation** features of the Tradutor AI tool. It contains *various* text styles, code snippets, headings, and even a chart image to verify that both text and images are properly handled during the translation process.

2. Technical Overview

2.1 System Architecture

The system is built using a **microservices architecture** with the following components: *API Gateway*, *Translation Engine*, and *Storage Service*. Each component can be scaled independently based on demand.

2.2 Configuration Example

Below is a sample configuration file in **YAML** format:

```
server: host: "0.0.0.0" port: 8080 debug: false database: url:
"postgresql://localhost:5432/app" pool_size: 10 logging: level: "INFO" format: "json"
```

3. Performance Metrics

The chart below shows the **quarterly performance** metrics for the fiscal year 2024. As you can see, Q4 had the highest growth rate at 150%.

4. Code Implementation

4.1 Main Function

The core translation function is implemented in **Python** using the *OpenAI API*. Here is the main processing loop:

```
def translate_document( input_path: str, output_format: str = "pdf" ) -> str: # Extract
text from source content = extract_text(input_path) if not content: raise
ValueError("Empty document") # Split into chunks chunks = chunk_text(content) #
Translate each chunk translated = [] for chunk in chunks: result = translate(chunk)
translated.append(result) return export(translated, output_format)
```

4.2 Error Handling

The system implements **exponential backoff** retry logic for *transient failures*. Up to **3 retries** are attempted with increasing delays of 2, 4, and 8 seconds.

5. Data Comparison

The table below compares **different translation engines** across key metrics:

Engine	Speed	Accuracy	Cost
OpenAI GPT-4	Fast	95%	\$\$\$
DeepSeek	Medium	88%	\$\$
Groq	Very Fast	82%	\$
Together AI	Fast	85%	\$\$

6. Conclusion

This sample document demonstrates various **formatting features** that should be preserved during translation: *italic text*, **bold text**, code blocks, headings at multiple levels, tables with data, and embedded images.

The translation tool should also **remove repeated headers and footers** automatically, keeping only the meaningful content for translation.

End of sample document. Happy testing!
